Teaching Hospitals**  
NHS Trust

Endoscopy Unit

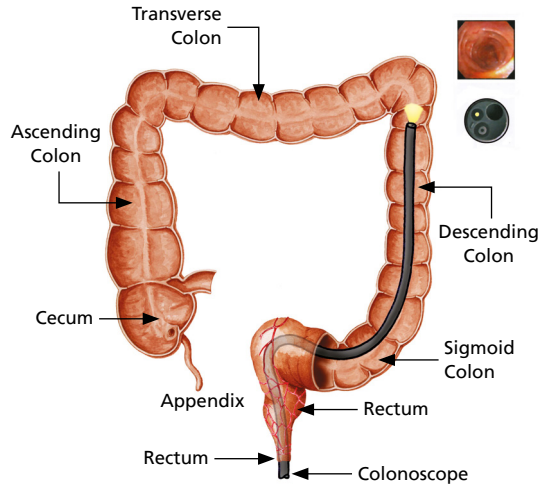

# Colonic Stent insertion

Information for  
patients

Your doctor has recommended that you have a **Colonic Stent Insertion**. This leaflet will explain the procedure and what to expect on the day of your test. If you have further questions, please ask the nurses or doctors on the ward or discuss them with a member of the Endoscopy staff on the day of your procedure.

### What is a Colonic Stent Insertion?

A colonic stent is a flexible metallic tube, specially designed to open the part of your bowel that is narrowed or blocked due to disease. Once it is in place, the stent is designed to expand and open so that there is a channel that waste products can pass through to reach the rectum. It is difficult to predict how long the procedure will take but usually it takes between 30 and 60 minutes.

## Why am I having a Colonic Stent Insertion?

Before the insertion of a colonic stent, other tests such as a CT scan or x-ray have shown that your bowel has become blocked. Your doctor will have discussed with you the likely cause of the blockage. There are different treatments available for people with a blocked bowel but a stent insertion has been proposed as the best treatment option for you. You should make sure that you have had the opportunity to discuss your treatment options with your doctor and if you feel uncomfortable about having a stent inserted, you can decide against it. Your decision will be fully respected and your doctor will be happy to discuss alternative options.

## What preparation will I need for my Colonic Stent?

The doctors will advise you of the bowel preparation that you will need for your colonic stent insertion. Sometimes, the doctor may decide that you will require enemas administering to clear the bottom half of your bowel on the day of your procedure.

You will need to wear a gown and remove any tight clothing for your comfort. Please inform the nurse or endoscopists about any allergies or reactions to medications you may have had.

## What are the risks of having a Colonic Stent Insertion?

There are six main potential complications directly involved in stent insertion:

- 1. Malpositioning:** Occasionally, the size and shape of the blockage makes it impossible to correctly place the stent. In this case, the doctor will stop the procedure and discuss alternative plans with you.

2. **Migration:** The stent may not remain in place, moving either above or below the site of the blockage. In this case, you may experience pain or urgency to open your bowels. Stent migration may require removal and replacement of the colonic stent.
3. **Perforation:** It is possible that the lining of the bowel wall may be torn during the operation. This occurs in approximately 4% - 5% of cases. If this happens, it can be serious and require an operation to resolve the complication.
4. **Bleeding:** A small amount of bleeding is expected but if you are concerned, contact us for advice with the numbers provided at the end of the leaflet.
5. **Pain:** Some discomfort is expected after the stent is placed; however, if your pain is severe it may indicate obstruction, perforation or migration and you should contact us for advice.
6. **Re-obstruction:** Over time, the narrowing may return and block the stent. This may cause pain, vomiting and discomfort. If you develop these symptoms, please contact us for advice. It may be necessary to place an additional stent to relieve this.

Complications may occur in up to 1 in 10 cases. Mostly these will be mild but you may need to remain in hospital for observation or have further treatment. In some cases, complications may be severe, requiring surgery, and rarely these can be life-threatening.

## What will happen on the day of the test?

When you arrive at the Endoscopy Unit, your personal details will be checked. The assessment nurse will check your medical history and any allergies. You will be able to ask any questions and discuss any worries or questions that you have about the stent insertion.

## What happens in the procedure room?

You will be greeted by two nurses who will remain with you during the procedure. You will be asked to remove any dentures or glasses and lay on your left-hand side with your knees slightly bent towards your chest.

You will be given some oxygen via a small cannula that sits in your nose and your pulse and oxygen levels will be monitored using a probe placed on your finger. Sometimes, we use sedation when stenting a stricture. The drugs used are a combination of a sedative (e.g. Midazolam) to relax you and a painkiller (e.g. Fentanyl). Occasionally, we also use a drug called Buscopan to relax the bowel. If you are finding the procedure more uncomfortable than you expected, please let the nurse know and you may be given more medication to make you feel more comfortable.

There are known adverse effects from the intravenous drugs administered during the procedure, ranging from mild and common to rare and serious. These include: headaches, nausea, fainting, depression of respiratory and nervous system, which may result in aspiration pneumonia, anaphylaxis and coma. Although these serious complications are rare, they are common in patients with deeper sedation and / or general anaesthesia.

When you are comfortable, a colonoscope (camera) will be passed into the bowel and then advanced to the area that is narrow. A wire is then passed through the colonoscope and across the narrowed area under x-ray guidance. The stent is then placed over the wire into the correct position.

**Please note:** all hospitals in the trust are teaching hospitals and it may be that a trainee endoscopist performs your procedure under the direct supervision of a consultant, registrar or nurse practitioner.

In around 1 in 10 cases, we are unable to correctly position the stent, either because of the angle of the bowel, or because the bowel is not clean enough. If this occurs, the doctor will talk to you about the options at the time.

## What happens after the test?

You will be transferred to the recovery room after the test. It is important to tell the nursing staff if you have any pain. You will have your pulse and blood pressure monitored to ensure there have been no complications. You will then return to the ward.

What to expect:

- you may experience some crampy abdominal pain as the bowel returns to normal function; and
- when the bowel is unblocked, it's normal to develop loose bowels for a few hours. This usually settles after a day or two.

## Care following a Colonic Stent Insertion

Your doctor will inform you how soon after the procedure you may eat and drink. It is recommended that you drink plenty of fluids with your meals and that you eat smaller meals more frequently. Try to avoid high fibre foods such as fresh fruit, raw vegetables, fruit or vegetable skins, food with seeds, nuts and tough meats.

You may be prescribed a stool softener and / or laxative.

## What should I do if I become unwell after the procedure?

If you experience any unusual pains in the abdomen, not relieved by passing wind, or a bleeding from the back passage following your stent insertion, please contact us. Bleeding or perforations can occasionally present several days after the procedure took place.

The stent can also block up with stool at any time. Signs that the stent has become blocked would normally include stomach cramps, nausea and inability to open the bowels.

**Please contact us for advice if you develop any of these symptoms. Remember to tell us that you have a colonic stent**

**Please see the back page for the contact numbers to use.**

### Contact numbers:

#### **Colorectal Specialist Nurses**

Tel: **0113 2065535** (Monday - Friday, 9.00 am - 5.00 pm)

#### **St. James's Surgical Assessment Unit**

Tel: **0113 2064888** (evenings and weekends)

This leaflet has been designed as a general guide to your test. If after reading this, you have any questions that you feel have not been answered, please contact the Endoscopy department on the numbers on below.

**Administration Team:** for any enquiry about your appointment including cancellation. Also, contact this number if you require an interpreter or transport.

Telephone: **0113 3920692**

**Monday - Friday, 9.00 am - 4.00 pm**

**Nursing Team:** please contact this number if you would like advice on your medication, or any other medical question or worry.

Telephone: **0113 3922585**

**Monday - Friday, 9.00 am - 4.00 pm**

**What did you think of your care?**
